## §5.1 Polynomial Functions and Models

A polynomial function is a function of the form

$$
f(x)=a_{n} x^{n}+a_{n-1} x^{n-1}+\ldots+a_{2} x^{2}+a_{1} x+a_{0}
$$

where $a_{n}, a_{n-1}, \ldots, a_{1}, a_{0}$ are real numbers and $n$ is a nonnegative integer.

Determine which of the following are polynomial functions. For those that are, state the degree; for those that are not, tell why not.
(a) $f(x)=2-3 x^{4}$
(b) $g(x)=\sqrt{x}$
(c) $h(x)=\frac{x^{2}-2}{x^{3}-1}$
(d) $F(x)=0$
(e) $G(x)=8$
(f) $H(x)=-2 x^{3}(x-1)^{2}$

## Summary of the Properties of the Graphs of Polynomial Functions

| Degree | Form | Name | Graph |
| :--- | :--- | :--- | :--- |
| No degree | $f(x)=0$ | Zero function | The $x$-axis |
| 0 | $f(x)=a_{0}, \quad a_{0} \neq 0$ | Constant function | Horizontal line with $y$-intercept $a_{0}$ |
| 1 | $f(x)=a_{1} x+a_{0}, \quad a_{1} \neq 0$ | Linear function | Nonvertical, nonhorizontal line with <br> slope $a_{1}$ and $y$-intercept $a_{0}$ |
| 2 | $f(x)=a_{2} x^{2}+a_{1} x+a_{0}, \quad a_{2} \neq 0$ | Quadratic function | Parabola: Graph opens up if $a_{2}>0 ;$ <br> graph opens down if $a_{2}<0$ |

(a) Graph of a polynomial function: smooth, continuous

(b) Cannot be the graph of a polynomial function

Polynomials are continuous (no breaks in the graph) and smooth (no sharp angles, only rounded curves)

Graphing Functions of the Form: $\quad P(x)=a x^{n}$

| $\mathrm{P}(\mathrm{x})=\mathrm{x}^{3}$ | $\mathrm{P}(\mathrm{x})=\mathrm{x}^{5}$ | $\mathrm{P}(\mathrm{x})=\mathrm{x}^{4}$ | $\mathrm{P}(\mathrm{x})=\mathrm{x}^{6}$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{P}(\mathrm{x})=\frac{1}{3} \mathrm{x}^{3}$ | $\mathrm{P}(\mathrm{x})=8 \mathrm{x}^{5}$ | $\mathrm{P}(\mathrm{x})=\frac{1}{8} \mathrm{x}^{4}$ | $\mathrm{P}(\mathrm{x})=9 \mathrm{x}^{6}$ |

Note: The graph of $y=x^{n}$ is similar to the graph of $\left\{\begin{array}{l}y=x^{2} \text { if } n \text { is even } \\ y=x^{3} \text { if } n \text { is odd }\end{array}\right.$, except that the greater $n$ is, the flatter the graph is on $[-1,1]$ and the steeper it is on $(-\infty,-1) \cup(1, \infty)$.

## Examining Vertical and Horizontal Translations (Shifts):

Example 1: Graph
a.) $y=-(x+2)^{4}+6$
b.) $y=-3-(x-1)^{3}$

Finding a polynomial from its Zeros:
Example Find a polynomial of degree 3 whose zeros are $-4,-2$, and 3 .

## Identifying Zeros and Their Multiplicities

For the polynomial, list all zeros and their multiplicities.

$$
f(x)=-2(x-2)(x+1)^{3}(x-3)^{4}
$$

## If $\boldsymbol{r}$ Is a Zero of Even Multiplicity

Sign of $f(x)$ does not change from one side Graph touches of $r$ to the other side of $r$. $x$-axis at $r$.

## If $r$ Is a Zero of Odd Multiplicity

Sign of $f(x)$ changes from one side of $r$ to the other side of $r$.

## Graph crosses <br> $x$-axis at $r$.

## Theorem

## Turning Points

If $f$ is a polynomial function of degree $n$, then $f$ has at most $n-1$ turning points.
If the graph of a polynomial function $f$ has $n-1$ turning points, the degree of $f$ is at least $n$.

## Example Graphing a Polynomial using x-intercepts

For the polynomial: $f(x)=x^{2}(x-2)$
(a) Find the $x$ - and $y$-intercepts of the graph of $f$.
(b) Use the $x$-intercepts to find the intervals on which the graph of $f$ is above the $x$-axis and the intervals on which the graph of $f$ is below the $x$-axis.
(c) Locate other points on the graph and connect all the points plotted with a smooth, continuous curve.

|  | 0 |  | ? |  |
| :--- | :--- | :--- | :--- | :---: |
|  | Interval |  | $(-\infty, 0)$ |  |
| Number Chosen | -1 | $(0,2)$ | $(2, \infty)$ |  |
| Value of $f$ | $f(-1)=-3$ | $f(1)=-1$ | $f(3)=9$ |  |
| Location of Graph | Below $x$-axis | Below $x$-axis | Above $x$-axis |  |
| Point on Graph | $(-1,-3)$ | $(1,-1)$ | $(3,9)$ |  |
