## §6.7 Compound Interest

## Simple Interest Formula

If a principle of $P$ dollars is borrowed for a period of $t$ years at a per annum interest rate $r$, expressed as a decimal, the interest $I$ charged is $\quad \mathbf{I}=\mathbf{P r t}$

## Formulas for Compound Interest:

After $\mathbf{t}$ years, the balance $\mathbf{A}$ in an account with principal $\mathbf{P}$ and annual interest rate $\mathbf{r}$ (in decimal form) is given by the following formulas:

1. For $\mathbf{n}$ compoundings per year:

$$
\mathrm{A}=\mathrm{P}\left(1+\frac{\mathrm{r}}{\mathrm{n}}\right)^{(\mathrm{n} \cdot \mathrm{t})}
$$

2. For continuous compounding:
$\mathrm{A}=\mathrm{Pe}^{(\mathrm{r} \mathrm{t})}$
Example (future value): A total of $\$ 12,000$ is invested at an annual interest rate of $9 \%$. Find the balance after 5 years if it is compounded:
a) quarterly.
b) continuously.

## Compound Interest (rate of interest):

Example : What annual rate of interest compounded annually should you seek if you want to double your investment in 5 years?

## Continuous Compounding:

Example : How long will it take for the money in an account that is compounded continuously at $5 \%$ to double ? Triple?

## §6.7 Compound Interest

## Simple Interest Formula

If a principle of $P$ dollars is borrowed for a period of $t$ years at a per annum interest rate r , expressed as a decimal, the interest $I$ charged is $\quad \mathbf{I}=$ ert $P=1000 \quad r=.08 \quad t=5 \mathrm{I}=$

## Formulas for Compound Interest:

After $\mathbf{t}$ years, the balance $\mathbf{A}$ in an account with principal $\mathbf{P}$ and annual interest rate $\mathbf{r}$ (in decimal form) is given by the following formulas:

1. For $\mathbf{n}$ compounding per year:

$$
\begin{aligned}
& \mathrm{A}=\mathrm{P}\left(1+\frac{\mathrm{r}}{\mathrm{n}}\right)^{(\mathrm{n} \cdot \mathrm{t})} \\
& \mathrm{A}=\mathrm{Pe}^{(\mathrm{r} \mathrm{t})}
\end{aligned}
$$

Example (future value): A total of $\$ 12,000$ is invested at an annual interest rate of $9 \%$. Find the balance after 5 years if it is compounded:
a) quarterly. $n=4$
$A=$
$A=$
$P=$
$n=$
$t=$
$r=$
$A=p\left(1+\frac{n}{n}\right)^{(n, t)}$
$=12000\left(1+\frac{.09}{4}\right)^{(4.5)}$

b) continuously.

$$
\begin{aligned}
A & =\rho v^{(.0)} \\
& =12000 e^{\wedge(.09 .5)} \\
& =188(9.7)
\end{aligned}
$$

Compound Interest (rate of interest):
Example: What annual rate of interest compounded annually should you seek if you want to double your investment in 5 years?

$$
\begin{aligned}
A & =P\left(1+\frac{r}{n}\right)^{(n \cdot t)} \\
\frac{2 P}{R} & =\frac{P\left(1+\frac{r}{1}\right)^{(1 \cdot 5)}}{R}
\end{aligned}
$$

$$
\begin{aligned}
2 & =\left((1+r)^{5}\right. \\
\sqrt[5]{2} & =\sqrt[5]{(1+r) x} \\
\sqrt[5]{2} & =1+r \\
r & =\sqrt[5]{2}-1
\end{aligned}
$$

Continuous Compounding:
Example: How long will it take for the money in an account that is compounded continuously at $5 \%$ to
double? Triple?
