

## Section 4.1 Antiderivatives and Integration

Antidifferentiation is the process of differentiation performed in reverse. Given a function  $f$ , we find another function  $F$  such that  $\frac{d}{dx}F(x) = f(x)$ . The function  $F$  is an antiderivative of  $f$ .

Example 1: If we found  $f'(x) = 2x$ , then what was  $f(x)$ ?

### Theorem

The **antiderivative** of  $f(x)$  is the set of functions  $F(x) + C$  such that  $\frac{d}{dx}[F(x) + C] = f(x)$ . The constant  $C$  is called the **constant of integration**.

If  $F$  is an antiderivative of  $f$ , we write  $\int f(x) dx = F(x) + C$ .

This equation is read as “the antiderivative of  $f(x)$ , with respect to  $x$ , is  $F(x) + C$ ” or as “the integral of  $f(x)$ , with respect to  $x$ , is  $F(x) + C$ .” The expression on the left side is called an **indefinite integral**. The symbol  $\int$  is the integral sign, and  $f(x)$  is the integrand. The symbol  $dx$  can be regarded as indicating that  $x$  is the variable of integration, similar to  $d/dx$  indicating that the expression that follows it is to be differentiated with respect to  $x$ .

Example 2: Determine these indefinite integrals. Find the antiderivative of each integrand. How can you check your answer?

a)  $\int 8 dx$

b)  $\int 3x^2 dx$

c)  $\int e^x dx$

d)  $\int \frac{1}{x} dx, x \neq 0$

### Rules for Antiderivatives

1. Constant Rule  $\int k dx = kx + C$
2. Power Rule (where  $n \neq -1$ )  $\int x^n dx = \frac{1}{n+1} x^{n+1} + C$
3. Natural Logarithm Rule  $\int \frac{1}{x} dx = \ln|x| + C$  and for  $x > 0$ ,  $\int \frac{1}{x} dx = \ln x + C$
4. Exponential Rule (base  $e$  and  $a \neq 0$ )  $\int e^{ax} dx = \frac{1}{a} e^{ax} + C$

The Power Rule for Antiderivatives can be viewed as a two-step process:

$$\int x^n dx = \frac{1}{n+1} x^{n+1} + C$$

1. Increase the exponent by 1.
2. Divide the term by the new power.

Example 3: Determine these indefinite integrals using the power rule for antiderivatives.

a).  $\int x^8 dx$

b).  $\int x^2 dx$

c).  $\int \sqrt{x} dx$

d).  $\int \frac{1}{x^3} dx, x \neq 0$

Example 4: Determine these indefinite integrals using the exponential rule for antiderivatives.

a).  $\int e^{4x} dx$

b).  $\int e^{2x} dx$

c).  $\int e^{-x} dx$

### Properties of Antiderivatives

1. A constant multiplier can be factored to the front of the indefinite integral.

$$\int c \cdot f(x) dx = c \cdot \int f(x) dx$$

2. The antiderivative of a sum or difference is the sum or difference of the antiderivatives.

$$\int f(x) \pm g(x) dx = \int f(x) dx \pm \int g(x) dx$$

Example 5: Find the following indefinite integrals. Assume  $x > 0$ .

a)  $\int (x^4 - x + 5) dx$

b)  $\int (3x^5 + 7x^2) dx$

c)  $\int (x - 3)^2 dx$

d)  $\int \frac{3x+2x^4}{x} dx$

e)  $\int \frac{4}{x} dx$

Example 6: Initial Condition: Use the information given to find C.

$$F(x) = \int (2x + 3) dx \text{ and } F(1) = -2$$

$$5. \int x^{1/4} dx$$

$$7. \int (x^2 + x - 1) dx$$

$$9. \int (2t^2 + 5t - 3) dt$$

$$11. \int \frac{1}{x^3} dx$$

$$13. \int \sqrt[6]{x} dx$$

$$15. \int \sqrt{x^5} dx$$

$$17. \int \frac{dx}{x^4}$$

$$19. \int \frac{10}{x} dx$$

$$21. \int \left( \frac{3}{x} + \frac{5}{x^2} \right) dx$$

$$23. \int \frac{-7}{\sqrt[3]{x^2}} dx$$

$$25. \int e^{3x} dx$$

$$27. \int 2e^{2x} dx$$

$$29. \int 6e^{x/2} dx$$

$$31. \int 100e^{0.02x} dx$$

## Section 4.1 Antiderivatives and Integration

Antidifferentiation is the process of differentiation performed in reverse. Given a function  $f$ , we find another function  $F$  such that  $\frac{d}{dx}F(x) = f(x)$ . The function  $F$  is an antiderivative of  $f$ .

Example 1: If we found  $f'(x) = 2x$ , then what was  $f(x)$ ?

$$f'(x) = 2x \quad \text{then} \quad f(x) = x^2$$

$x^2 + 5$   
 $x^2 - 17$

In general  
 $f(x) = x^2 + C$

### Theorem

The **antiderivative** of  $f(x)$  is the set of functions  $F(x) + C$  such that  $\frac{d}{dx}[F(x) + C] = f(x)$ . The constant  $C$  is called the **constant of integration**.

If  $F$  is an antiderivative of  $f$ , we write

$$\int f(x) dx = F(x) + C.$$

integral  $\nearrow$

variable  $\nearrow$

$\nwarrow$  constant

This equation is read as "the antiderivative of  $f(x)$ , with respect to  $x$ , is  $F(x) + C$ " or as "the integral of  $f(x)$ , with respect to  $x$ , is  $F(x) + C$ ." The expression on the left side is called an **indefinite integral**. The symbol  $\int$  is the integral sign, and  $f(x)$  is the integrand. The symbol  $dx$  can be regarded as indicating that  $x$  is the variable of integration, similar to  $d/dx$  indicating that the expression that follows it is to be differentiation with respect to  $x$ .

Example 2: Determine these indefinite integrals. Find the antiderivative of each integrand. How can you check your answer?

a)  $\int 8 dx$

$$= 8x + C$$

b)  $\int 3x^2 dx$

$$= x^3 + C$$

c)  $\int e^x dx$

$$= e^x + C$$

d)  $\int \frac{1}{x} dx, x \neq 0$

$$= \ln|x| + C$$

$\nearrow$  why absolute value?  
can't take the log of a negative number.

### Rules for Antiderivatives

1. Constant Rule  $\int k dx = kx + C$
2. Power Rule (where  $n \neq -1$ )  $\int x^n dx = \frac{1}{n+1} x^{n+1} + C$
3. Natural Logarithm Rule  $\int \frac{1}{x} dx = \ln|x| + C$  and for  $x > 0$ ,  $\int \frac{1}{x} dx = \ln x + C$
4. Exponential Rule (base  $e$  and  $a \neq 0$ )  $\int e^{ax} dx = \frac{1}{a} e^{ax} + C$

The Power Rule for Antiderivatives can be viewed as a two-step process:

$$\int x^n dx = \frac{1}{n+1} x^{n+1} + C$$

The diagram shows the formula with a circled '1' above the exponent 'n+1' and a circled '2' below the denominator 'n+1', indicating the two steps of the process.

1. Increase the exponent by 1.
2. Divide the term by the new power.

Example 3: Determine these indefinite integrals using the power rule for antiderivatives.

a).  $\int x^8 dx =$

$$\frac{1}{8+1} x^{8+1} + C = \frac{1}{9} x^9 + C$$

b).  $\int x^2 dx =$

$$\frac{1}{2+1} x^{2+1} + C = \frac{1}{3} x^3 + C$$

c).  $\int \sqrt{x} dx = \int x^{1/2} dx =$

$$\frac{1}{\frac{1}{2}+1} x^{\frac{1}{2}+1} + C = \frac{2}{3} x^{3/2} + C$$

d).  $\int \frac{1}{x^3} dx, x \neq 0 = \int x^{-3} dx$

$$\frac{1}{-3+1} x^{-3+1} + C = \frac{1}{-2} x^{-2} + C$$

Example 4: Determine these indefinite integrals using the exponential rule for antiderivatives.

a).  $\int e^{4x} dx =$

$$\frac{1}{4} e^{4x} + C$$

b).  $\int e^{2x} dx =$

$$\frac{1}{2} e^{2x} + C$$

c).  $\int e^{-x} dx =$

$$-e^{-x} + C$$

Properties of Antiderivatives

1. A constant multiplier can be factored to the front of the indefinite integral.

$$\int c \cdot f(x) dx = c \cdot \int f(x) dx$$

2. The antiderivative of a sum or different is the sum or difference of the antiderivatives.

$$\int f(x) \pm g(x) dx = \int f(x) dx \pm \int g(x) dx$$

Example 5: Find the following indefinite integrals. Assume  $x > 0$ .

a)  $\int (x^4 - x + 5) dx$

$$\frac{1}{5}x^5 - \frac{1}{2}x^2 + 5x + C$$

b)  $\int (3x^5 + 7x^2) dx$

$$3\left(\frac{1}{6}\right)x^6 + 7\left(\frac{1}{3}\right)x^3 + C$$

$$\frac{1}{2}x^6 + \frac{7}{3}x^3 + C$$

c)  $\int (x-3)^2 dx = \int x^2 - 6x + 9 dx$

$$\frac{1}{3}x^3 - 6\left(\frac{1}{2}\right)x^2 + 9x + C$$

$$\frac{1}{3}x^3 - 3x^2 + 9x + C$$

d)  $\int \frac{3x+2x^4}{x} dx = \int \frac{3x}{x} + \frac{2x^4}{x} dx$

$$= \int 3 + 2x^3 dx$$

$$= 3x + 2\frac{1}{4}x^4 + C$$

$$= 3x + \frac{1}{2}x^4 + C$$

e)  $\int \frac{4}{x} dx$

$$4 \int \frac{1}{x} dx$$

$$4 \ln x + C$$

Example 6: Initial Condition: Use the information given to find C.

$$F(x) = \int (2x + 3) dx \text{ and } F(1) = -2$$

$$F(x) = \int (2x + 3) dx = x^2 + 3x + C$$

$$F(1) = 1^2 + 3(1) + C = -2$$

$$4 + C = -2$$

$$C = -6$$

$$F(x) = x^2 + 3x - 6$$

WS in class

$$5. \int x^{1/4} dx = \frac{4}{5} x^{5/4} + C$$

$$7. \int (x^2 + x - 1) dx = \frac{1}{3} x^3 + \frac{1}{2} x^2 - x + C$$

$$9. \int (2t^2 + 5t - 3) dt = \frac{2}{3} t^3 + \frac{5}{2} t^2 - 3t + C$$

$$11. \int \frac{1}{x^3} dx = \int x^{-3} dx = -\frac{1}{2} x^{-2} + C$$

$$13. \int \sqrt[6]{x} dx = \int x^{1/6} dx = \frac{6}{7} x^{7/6} + C$$

$$15. \int \sqrt{x^5} dx = \int x^{5/2} dx = \frac{2}{7} x^{7/2} + C$$

$$17. \int \frac{dx}{x^4} = \int x^{-4} dx = \frac{1}{-3} x^{-3} + C$$

$$19. \int \frac{10}{x} dx = 10 \ln|x| + C$$

$$21. \int \left( \frac{3}{x} + \frac{5}{x^2} \right) dx = 3 \ln|x| - 5x^{-1} + C$$

$$23. \int \frac{-7}{\sqrt[3]{x^2}} dx = \int -7x^{-2/3} dx = -21x^{1/3} + C$$

$$25. \int e^{3x} dx = \frac{1}{3} e^{3x} + C$$

$$27. \int 2e^{2x} dx = e^{2x} + C$$

$$29. \int 6e^{x/2} dx = 12e^{x/2} + C$$

$$31. \int 100e^{0.02x} dx = 5000e^{0.02x} + C$$
